

Prompt Documentation

Purpose

Prompts were designed for interpretation, counter-analysis, recommendation refinement, and executive communication while requiring validation against project evidence.

Prompt set

- Interpret the customer retention findings using the available one-time versus repeat customer statistics. Separate observed facts from possible explanations.
- Review delivery-delay and review-score findings. Identify what the evidence supports and what it does not prove.
- Generate alternative explanations for the observed price-freight relationship without claiming causation.
- Challenge the initial business interpretation and identify what additional evidence would be required for a stronger claim.
- Using only validated findings, propose measurable customer-retention recommendations.
- Convert validated findings into an executive-level summary focused on impact, risks, and actions.

Approach

Prompts explicitly required separation of observation, inference, and unsupported causation to reduce the risk of presenting AI assumptions as dataset findings.
